

Innovative solutions for

WORKWEAR MANAGEMENT

Workwear and storage management

Efficient and flexible - the perfectly coordinated modules
for more economic efficiency

Professional management of workwear

Whether leasing or customer owned laundry, whether wearer-related or pool laundry: all workwear items can be professionally managed and accounted in TIKOS. Extensive evaluation options facilitate daily work.

Detailed wearer management

All wearers are recorded with all relevant data. Each person is assigned an item assortment. Individual wearers can be re-booked and discontinued. The complete history of individual item orders, stock, or size changes can be viewed at any time.

Unique identification number for every item

Each item is assigned a unique identification number (barcode, QR code, or RFID chip). All movements of a garment are recorded. Thus, the complete history of an item is available, from purchase to all storage movements to washing cycles, rework, and repairs. The patch labels can be generated using all printers commonly used in the industry.

Digitalised work instructions

If an item is to be retained, repaired, or treated separately, the corresponding signal (work instruction for your employees) only has to be set. These signals can be set on an item-related or time-controlled basis. Any number of signals can be assigned to an item.

Storage management with ordering

Optimise your storage activities and keep track of which item is in stock and in what quantity. Items that are not in stock can be easily and conveniently reordered from your suppliers. The due date of the deliveries is constantly monitored by the system.

Storage management

- Precise assignment of storage and location per item
- Flexible allocation of deviating storage locations
- Differentiation between new and used items

Price management

- Assignment of several suppliers and purchase prices per article
- Flexible definition of selling prices
- Flexible display of the price development as well as the investment sums per customer and item

Residual value management

Residual values can be determined exactly before the end of the contract in the case of early replacement of items. Customer-specific depreciation periods, sales prices, or individual minimum residual values are taken into account. Time-controlled reminders or automated residual value calculations simplify daily work.

Sales management

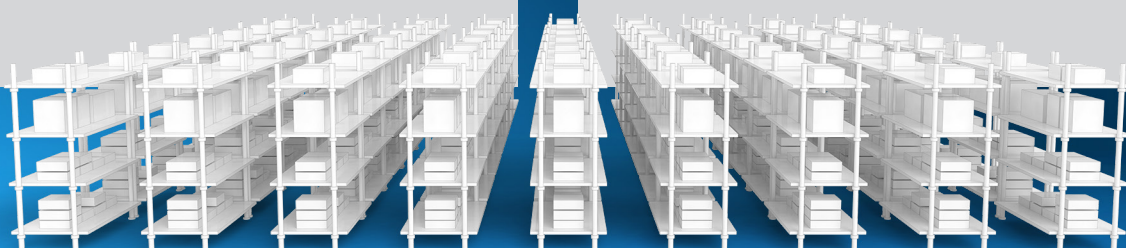

The sales of laundry articles completes the range of services of many laundries. For each item, a special sales price can be stored in addition to the washing and rental price. An offer, delivery note, or invoice can be generated directly for a sales enquiry. Stocks are automatically adjusted - without additional maintenance effort.

Textile labelling

Individual label designs with barcodes or QR codes are possible. All labels can be produced with industry-standard printers. In addition, the design of container labels, locker labels, or adhesive labels for the storage of workwear is provided.

Repair management

All information on repairs (amount of work, employees, date of repair) can be accessed in TIKOS with one click, is documented continuously, and provides you with the basis for your invoicing. A continuous assessment of your employees and suppliers contributes to quality assurance.

App and web solutions

Use your potential to optimise your processes - by automating many processes, various task areas can be handled directly by your customers.

Transparency and high level of service

The applications provide exact insights into stocks, movements, item status, and invoice data for your customers. Numerous functions also enable your customers to perform all administrative tasks themselves: registering and deregistering wearers, adding and removing workwear, user administration and much more.

The texScan app

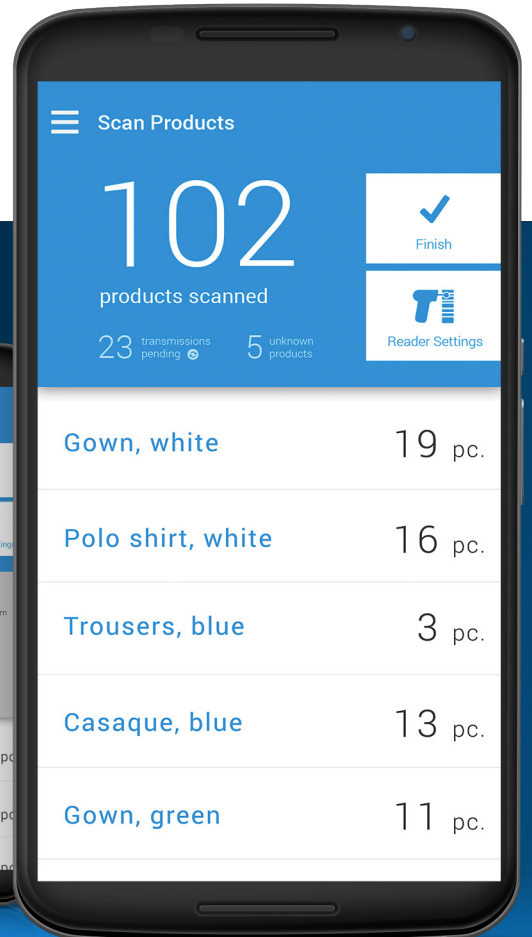

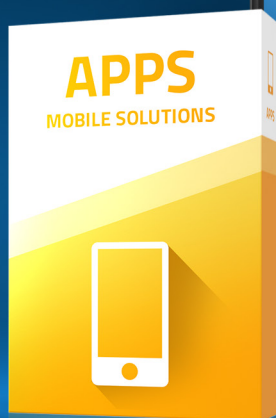

The texScan app allows location-independent registration of quantities via RFID or barcode scanner. Inventory data, eliminations, goods-in and goods-out as well as other movement data can be recorded cost-effectively and mobile.

The texUniScan app

With the help of this app solution, your service staff can carry out the mobile locker check directly on site so that all items are in the correct locker compartment.

Issue garments automatically

There are various integration options, depending on which supplier you prefer. Talk to us about your requirements.
