

texOrder app

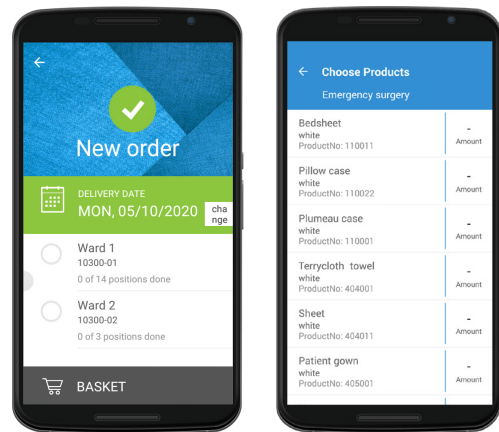

Your laundry management in an app and in the cloud

The texOrder app allows you to record the quantities of an order or inventory where they are created - mostly at your customers. Give your customers a smart tool for the **independent execution of orders or inventories**. Clear menu navigation and intuitive user interfaces ensure quick familiarisation without any training effort. Invest in the service quality of your laundry with the texOrder app and benefit from a significant **increase in your performance**.

Information available offline

When you start this app, information on customers, departments, and articles is transferred from TIKOS to your smartphone on the day of delivery. The advantage: **orders or inventories** can also be carried out without a continuous mobile network or Wi-Fi - even **offline** a smart tool for your customers. **Immediately** after completing your orders and inventories, the **data exchange** also takes place the other way round. The data is immediately available in TIKOS and can be further processed there.

In addition, **important information texts** can be stored for each customer, e.g. to inform them about the order deadline or the order time. If you take over the laundry management for your customers, you can provide your employees with the texOrder app and thus ensure an efficient process.

Recording of delivery quantities

With the help of the texOrder app, **delivery quantities for individual departments** can also be recorded and transmitted directly to TIKOS. In this way, laundry quantities that are delivered to a department, e.g. from a central storage facility at your customer's, can be viewed and evaluated in statistics. This makes it easy to gain an insight into the actual consumption of laundry quantities per department.

Advantages

- Expanding your range of services
- Strengthening your image as a modern and innovative company
- Optimisation of your processes: significantly reduced ordering and inventory times
- Location-independent execution of orders and inventories with the app as well as in the online portal
- Clearly structured dashboard
- Sophisticated and modern design: quick change between individual functions possible
- Good performance: no waiting and loading times, orders and inventories can be recorded extremely quickly
- Use of external scanners via Android Broadcast possible

Functions

- Recording of orders and inventories
- Multiple entries per day and station possible
- Individually definable display of the article sequence per customer possible
- Data synchronisation via Wi-Fi or mobile network
