

texPortal order and inventory

Orders, inventories and a lot more via an online portal in real-time

Time-independent orders and inventories directly **via an Internet portal** - this is what the texPortal order and inventory makes possible. Provide your business partners with a powerful tool and save time and money.

User management with assignment of individual rights

Your customer's data is synchronised with the portal server via the Internet. Each client receives his **individual access data**. This ensures they can only view their own data. Basic rights can be set per customer, depending on which functions you want to enable for your customer. Each client has its **own user administration**, where in turn each user can have individual rights to the functions enabled for the client. Restrictions can be set at menu level as well as at customer and department level. In evaluations, columns can be activated or deactivated per customer.

Overview and control

Daily orders or inventories are recorded in the portal. Both standard delivery quantities and maximum order quantities are taken into account. Both figures can be stored exactly to the day of the week per item and ward. It is also possible to enter inventories on the wards at any time. As a control function, orders and inventories can additionally be downloaded and printed by users as CSV and PDF files. In addition, users can be notified via email when the order has been received in the laundry. Using the rule and notification service in TIKOS, you can, for example, automatically inform your customers if no order has been received in the system X hours before the order deadline. This way, the data should be in the system early enough for picking. A wide variety of evaluations can be called up in Excel format via the portal to be processed easily and directly.

Your customer portal, your style

In the portal for your customers, you have the option to customize the appearance to match your company. With just a few clicks, you can upload your company logo and set your individual company color.

Advantages

- Time-independent orders and inventories
- Customer-specific user administration
- Suggestion of standard delivery quantities
- Consideration of maximum order quantities
- Inventory recording
- Control printout of orders and inventories via CSV, Excel, or email
- Individual advertising and news
- Automatically inform customers at an early stage if the order or inventory has not yet been received
