

texRepair app

Record repair orders digitally – simple, fast, efficient

With the texRepair app, necessary repairs to items can be reported directly by wearers, residents, or employees of your end customers – quickly, easily, and without creating additional work for your staff. This smartphone and tablet solution eliminates the need for separate handover of damaged garments and manual repair checks upon goods-in, significantly reducing processing times.

Create repair orders via touch

Repair areas can be **marked** directly on a preview image **with just a touch** and illustrated more precisely with up to two photos.

The repair order is completed with a **reason for the repair** and optional **additional information** for the laundry service.

In the laundry, the repair **appears** as a signal either at the goods-in or goods-out stage **directly in TIKOS**, including **all relevant information needed for the repair**.

Tracking item identification

A clear identification mode provides valuable information about each garment. In addition to **person-specific and item-specific data**, users can view a wash counter and a history of past repairs. The texRepair app can capture all common types of codes such as barcodes, QR codes, or RFID chips. For the user, this means no additional software or interface is required – the information is instantly and seamlessly available in the system.

Advantages

- Process optimisation: No more manual repair checks and simplified repair order creation thanks to accurate information
- User-friendly app for your customers, available for Android and iOS devices via app stores
- Clear overview of repair orders
- Tracking item identification with detailed information

Functions

- Record repair orders including detailed descriptions via touch and photo documentation
- Multiple repair reports per item possible
- Mobile tracking item identification
