

# texRoute app

## Mobile route management for laundry businesses

An **efficient processing of routes**, an increased profitability and transparency thanks to mobile route management – this is made possible by texRoute, the app especially developed for laundries.

### Online portal and real-time transmission

In the web solution accompanying the app, the texPortal, routes can be viewed that have been loaded onto the smartphone in the texRoute app. **Ongoing data synchronisation** via a secure internet connection of the smartphone with the laundry software makes all data available in real-time, always, and everywhere. This means that the driver not only receives automatic updates on his smartphone in the event of last-minute changes, but the web solution also enables you to **track your drivers live** and shows you the current delivery status of each route, in addition to numerous other displays. Set-up times, driving times, and dwell times at the customer's premises can also be displayed.

### Container management included

Too many, too few, or incorrectly loaded containers? A problem familiar to many, the customer is annoyed and it is not uncommon for containers to have to be redelivered individually at a later date. With texRoute, you can get rid of this. With the help of the texRoute app, **container movements are recorded digitally**. At the same time, checks for completeness and plausibility take place during loading and unloading. As soon as the used smartphone has an Internet connection, all container movements are transmitted directly to the ERP system. Even if your driver is still on the road, you can already call up the current data.

### Advantages

- Strengthening your image as a modern and innovative company
- Transparency: Clear presentation of routes
- Optimisation of your processes: automatic route changes in real-time
- Individual use through numerous interfaces, use of external scanners via Android Broadcast possible
- High level of user-friendliness thanks to clear design and device independence

### Functions

- Route management with navigation function
- Container control during loading and unloading of the vehicle
- Automated data synchronisations via Internet
- Telephony and messaging
- Live tracking: tracking and vehicle location, storage of driving times, and dwell times at the customer's premises
