

texUniScan residential laundry*

App module for mobile residential laundry management

Reduced workflows for textile service companies in the management of residential laundry: The corresponding modules of our texUniScan app enable laundries to transfer the allocation of individual items to care facilities and thus reduce processing times in the laundry.

Identification and assignment of individual items

Identification numbers of individual items in the form of **barcodes**, **QR codes** or, via Android Broadcast in combination with an corresponding external scanner, **RFID codes**, can be scanned with the smart texUniScan app and thus quickly identified. This enables the immediate display of important information about the scanned item. Pre-printed laundry labels can be patched by the care facilities themselves and assigned with the help of the texUniScan app. Information such as article, processing type and delivery type can be transferred directly to the TIKOS ERP system via the app. If a laundry item of a resident then enters the textile service facility for the first time, **all necessary information is already stored** and no additional processing effort is required.

Advantages

- Quick information on laundry items
- Patching of individual items directly in the care facility and direct transfer of information into our ERP software TIKOS
- No need for PC workstations
- Mobile barcode and QR code scanner via camera
- Use of external scanners via Android Broadcast possible

Functions

- Individual item identification
- Assignment of individual items

*The prerequisite for the application of this module is the TIKOS module residential laundry.
