

texUniScan flatwork

App module for mobile flatwork management

Direct, mobile access to information on flatwork items - with our texUniScan app, information on laundry items is available at all times. The smart solution thus contributes to **more efficient processes**.

Individual item identification and information display

texUniScan enables **quick and easy identification** of individual items by scanning barcodes, QR codes or, in combination with an external scanner via Android Broadcast, also RFID codes. The app then displays, for example, information about the last entry into or exit from the laundry. texUniScan is thereby not only used in textile service companies, but also directly at the customer's premises. For example, it is possible to scan the identification numbers of duvets in care facilities and use the information display of the last laundry entry to decide whether the scanned item should be used again or sent for washing.

Advantages

- Fast information on laundry items
- Further processing of the recorded information with the help of our ERP software TIKOS
- No need for PC workstations
- Mobile barcode and QR code scanner via camera
- Use of external scanners via Android Broadcast possible

Functions

- Individual item identification
