

# texUniScan storage management

## App module for mobile storage management

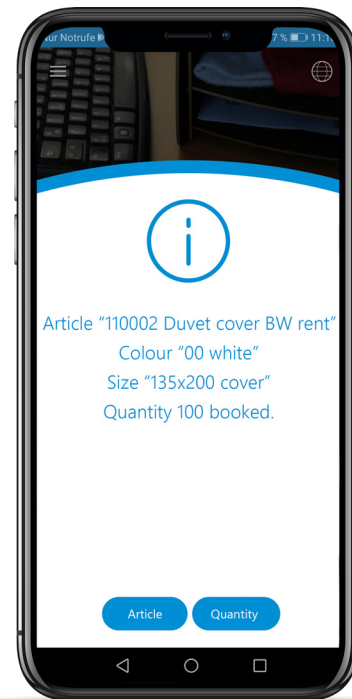

**Digitising and simplifying** the workflows in the storage is possible with the texUniScan app and the associated storage management module. The paperless processes with our mobile app reduce working times and eliminate sources of error.

### Manual storage bookings

Storage bookings can be made very easily with the help of texUniScan, **both in the new and the used items storage**. The bookings are made by selecting the item information in the form of manual entries in the texUniScan app or by scanning the corresponding barcodes or QR codes, which are attached to the storage shelves. Through the direct connection with our ERP software TIKOS, storage increases and decreases are **automatically booked**.

### Inventories of individual items

The texUniScan app also contributes to the digitisation of individual item inventories. By **simple scanning of the individual items**, the corresponding storage level is displayed. All items that are in stock according to the database, but are not scanned during the inventory, are directly eliminated with a reason that can be defined by the user. Afterwards, an updated storage level is available as well as an overview of all items that were not scanned during the inventory.

### Advantages

- Fast recording of inventories of all items in the storage facility
- Mobile booking of storage movements
- Digitalisation of processes
- Further processing of the recorded information with the help of our ERP software TIKOS
- No need for PC workstations
- Mobile barcode and QR code scanner via camera
- Use of external scanners via Android Broadcast possible

### Functions

- Manual storage bookings
- Single item inventories with automated rejection of not found items
