

TIKOS container management

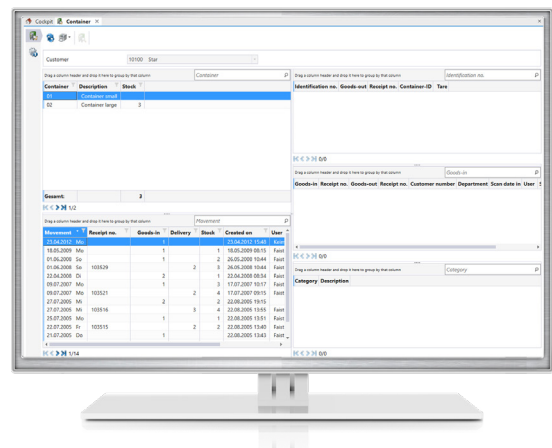

Instrument for complete recording

Take action against container shrinkage and the associated acquisition of new containers. The container management module enables you to **monitor container movements** by seamlessly recording and documenting all containers. This not only saves acquisition costs for new containers, but also time.

Complete recording through identification numbers

Thanks to the recording of **all container arrivals and departures** with identification numbers and direct documentation in the TIKOS database, it is **always possible to see** which containers are in stock and where they are in circulation. In addition to recording container movements, it is also possible to document disinfection or the time when a container passed through a lock.

Containers that have not been returned can easily be charged to the customer thanks to a clear proof of delivery. A fair rental model also makes it possible to easily charge containers that are with the customer for a longer period of time. The rental model only takes into account the charging of individual containers that are at the customer's premises in addition to an agreed free quantity. It is also possible to charge a service fee per container or a container deposit.

Overview even on the road through delivery note and route receipt

All container management parameters can be **individually adapted** and tailored to the respective customer. Thus, delivered containers can be recorded by manually entering the quantity or by recording the unique container numbers. An overview during loading and transport of the containers is provided by printing the total stock intended for delivery or the respective individual containers directly on the delivery note. In addition, a route document with customer data, route and delivery date can be printed when the container is assigned or packed. The storage of one or more **laundry categories per container**, which makes it easy to prove which articles were delivered to a customer, also contributes to more clarity.

Further benefits through scale connection

In combination with the scale connection module, the tare weight no longer has to be entered manually at the scale. In addition, the container movements and container stocks at the customer's premises are booked without any additional effort. **Overall evaluations of container stocks** and movements as well as evaluations at customer level can be easily created.

Advantages

- Structured recording and complete documentation
- Proof of container dwell times at the customer and possible calculation of rental, deposit and service fees
- Laundry categories per container for quick proof of delivery to the customer
- Labelling of containers with delivery information
