

TIKOS label printing

The module for your individual label design

A high degree of traceability is achieved through **systematic labelling of the textiles**. Our TIKOS module label printing supports you in individual item tracking and thus ensures maximum transparency - especially in the area of residential laundry, workwear, surgical textiles or even flatwork and dust control mats.

Individual design and diverse formats

With the help of this module you can design your own individual labels. **All common formats** are available: barcode, QR code, etc. The important information components (variables) are conveniently inserted from the master data of your TIKOS database, thus **avoiding errors and redundancies**. In addition, all printers customary in the industry can be controlled - even several printers simultaneously. For example, container labels, locker labels, or adhesive labels for the storage of workwear can be printed.

Large label selection and label calculation

In the TIKOS label printing you can store **up to 255 different labels** per service type. Furthermore, individualised labels per article and customer can be stored (e.g. labels that can/cannot be ironed). Label printing can be accounted for the customer by means of the system in a simple way – individually or as flat rate.

Advantages

- Individual Design
- All commonly used barcode formats available
- All printers can be used (simultaneously)
- Comfortable data input from the TIKOS master data
- Several labels per service type, customer, or article
- Label accounting
