

TIKOS package management

Efficient handling even for small wash orders

With the TIKOS package management module, you can easily serve small customers yourself and organise laundry delivery efficiently and in a time-saving manner. Small orders are grouped into packages and assigned a unique identification number, enabling seamless tracking.

Route management

When used in conjunction with the TIKOS route management module, packages and containers can be combined and several laundry packages can be transported in a single container. This means that, for example, when loading the vehicle with the help of the texRoute app, only the container needs to be scanned. The container contents are displayed automatically, which in turn saves a considerable amount of time and simplifies handling. In principle, containers and packages can also be processed separately

Well organised

With TIKOS's clear management of individual packages, you can set the right order in the container right away, so the packages are sorted in the right order for the route and can be tracked at any time.

Wherever container movements are visible, all package movements are automatically visible too. This is the case for

- TIKOS route management
- texPortal route
- On delivery notes

Advantages

- Efficient handling of small orders
- Simple organisation with laundry packages
- More storage space in vehicles using packages and containers
