TIKOS roller towel dispensers
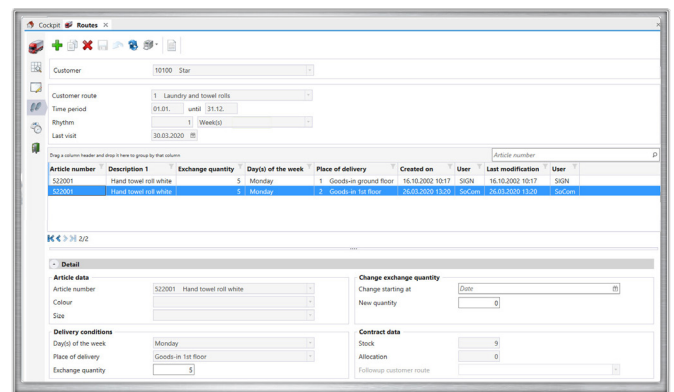

The module for optimised washroom hygiene

Automate the changing of roller towels and the calculation of dispensers and rolls with our roller towel dispenser module. **Clearly and transparently**, the stocks of dispensers and towel rolls can be defined for each individual customer and calculated with fixed rental prices or with different prices depending on the change rhythm.

Individual pricing structure and different places of delivery

The towel dispensers can be charged either with a **single price** (purchase by customer) or with a **rental price**. In the case of flat-rate invoicing, a distinction can be made between advance or subsequent billing. Any free rolls (e.g. inclusive rolls included in the dispenser rental) are automatically taken into account on the invoice. Different delivery locations can be defined per customer.

Change rhythms for different time periods

In the route organisation, the change rhythms for **different time periods** (seasonal contract) are defined. For each combination, the towel rolls can then be entered with delivery location and expected change quantity. By printing the route documents (route list and/ or delivery notes), an order is saved without quantities. Depending on the change rhythm, the price from the master data is used accordingly. The driver can note the actually changed rolls on the route list or the delivery note. The change quantities per customer and route are entered via a separate data entry program. With the help of the texRoute app, our app for mobile route management, the quantities can be changed directly on site with a smartphone. This data is then available for invoicing without further processing.

Advantages

- Different billing methods with flat-rate rental prices, prices depending on the exchange frequency, effective exchange calculation of towel rolls as well as the option of pre- or post-billing
- Transparency thanks to inventory history for towel dispensers and rolls
- Overview thanks to stock and disposition list
- Automated printing of delivery notes
- Easy integration of different delivery locations per customer and sporadic customers on a route
- Management of inclusive rolls
