

TIKOS statistics

For more overview and important decisions

Our TIKOS statistics module helps you to comprehensively display and analyse your data in detail. You quickly get an **overview of extensive and complex sets of figures** using, among other things, graphical representation in the form of diagrams - the basis for important future decisions.

Comparisons with the prior year figures

All quantities and turnovers are **kept chronologically** per item, customer, and department. A distinction is made between rental and processing turnover, as well as between sales, residual values, etc. The statistics are printed monthly and per business year. For each customer, each department, and each article, the percentage share of the group turnover (customer group or article group) and of the total turnover is displayed. The turnover of articles and customers can also be **recorded for previous years**. This makes it possible to compare all current turnovers with the previous year's figures. Turnover increases and decreases are illustrated by **monthly percentage figures**. The previous year's comparison statistics are printed on the customer data sheet together with other important customer data. With this tool, you can very quickly determine whether a customer is slowly but surely switching to a competitor.

Tabular or graphic display

All statistics can be **displayed graphically**. Bar charts, line charts, pie charts, and stack bar charts in 2D or 3D are available for display. All statistical data can also be transferred to Excel. The statistical data is prepared by printing the invoice. If invoices are subsequently corrected, the statistics are also corrected automatically. In addition, however, **statistical evaluations** are available that can be viewed before the invoice is printed. In this case, the data from the current orders is used. Even rental prices can be listed up to the invoice date and included in the evaluation. Thus, an exact turnover preview is possible, even during a month.

Easy display of top performers

The customer hit list can be used to evaluate top performers. For example, the customers with the highest turnovers or the customers with the most laundry items can be filtered and displayed. If required, the customer hit list can be filtered in more detail according to time or customer type (e.g. only hotel customer) in order to display meaningful characteristics.

Advantages

- Overview through separation of rental, washing, sales, and residual value turnover
- Overview through tabular or graphical representation in the form of different diagrams
- Transparency through comparisons with previous years with changes in percent
- Export to Excel and other formats
