## The module for a controlled overview

**Optimise your storage activities** and always keep an overview with our storage management module. You quickly have the information at hand about which item is in stock where and in what quantity, also with an indication of minimum stocks. With the integrated ordering system, **supplier orders can be carried out easily and conveniently**.

### Clear supplier master data

**Several suppliers with corresponding order information** can be entered per article. A percentage extra charge can be entered in the supplier master data, ensuring that **the appropriate sales price is automatically suggested** after the purchase price has been entered. In addition, the order number, any packaging units, price units and granted discounts are stored. Quantity-dependent purchase prices (quantity scale) can be entered. A history of price changes is available for all supplier prices. A **clear invoice comparison** also provides a simple, time-saving control option. Time-consuming checks are no longer necessary. Contact persons can be stored in the supplier master data and a complete contact management with follow-up function is available. By storing all kinds of business correspondence in the contact management, such as emails, documents, PDF files, etc., all employees are kept up to date - no information can get lost. In addition, access data (e.g. for orders) can be stored with the supplier. If suppliers do not deliver on time, the **integrated reminder system** can be used to draw attention to the fact. Overdue fees, storable reminder texts and up to three reminder levels allow for easy handling.

### Integrated ordering

When reserving workwear, the stock can be clearly viewed at any time. At the same time, it is possible to enter an order quantity without having to switch to an order mask. Collective order quantities can be combined into one order and transmitted to suppliers. Orders that have not yet been delivered can also be **easily viewed** and the due date can be monitored. Stock levels are recorded for the new and the used items storage separately. Respective storage locations can be stored for each colour and size. Minimum and maximum stock levels can be stored to create order suggestions. If the stock falls below the minimum level, an internal email can be triggered. All **stock movements are recorded** and can be evaluated. For example, the investments per customer and item over a certain period of time can be easily and clearly displayed.

### Pool storage

In addition to the actual storage, the pool storage is shown, equipped with similar functions. All customer orders in the daily business are served from the pool storage. With this type of intermediate storage, you can see **the actual availability of pool laundry at any time**. Based on minimum and maximum stocks per delivery day, you can control your laundry process to serve all customers from the pool storage or, if necessary, add various laundry items from the storage on individual days.
