

# TIKOS ward supply

## The module for optimal consumption control

Measure the **consumption of your customers in different departments of healthcare facilities and hotels**, adjust supply quantities accordingly, and thus benefit from **considerable savings** in the area of personnel costs and textile purchasing - with our ward supply module.

Standard delivery quantities or orders as required

**Simplified laundry management** that supplies individual hospital wards or hotels **without additional work** is possible with standard delivery quantities. A quantity can be stored per ward, article, and weekday, which is supplied as standard. An order by the customer is only necessary if additional quantities are required. If desired, sporadic inventories can be carried out on the wards in order to **adjust the delivery quantities to remaining stocks**. Standard quantities can also be adjusted manually or automatically based on average quantities. The period for which the adjusted delivery quantities are to be determined is freely defined. As an alternative to standard delivery quantities, customers can report demand via orders, for example with our mobile ordering app texOrder. If an ordering customer misses the agreed order deadline, an order is automatically generated at the last possible time. If an order is placed after the order deadline, an express surcharge can be charged separately. The calculation of additional costs can be stored per customer and department.

## Comparison of target and actual stock

As a supplementary delivery option, it is possible to **fill the lockers in the stations up to the target stock**. The current quantities are recorded with a mobile recording device, for example using our texOrder app, directly during filling the lockers. The data can then be transmitted digitally to the laundry. In addition, corresponding **target stocks per station, article, and weekday can be stored** in advance. By recording the actual stocks, the required quantities can then be determined by subtracting the actual stock from the target stock. In addition, any stored reserve quantities or unique special quantities for a certain period, for example for events, can be recorded. Deliveries that fall on a public holiday can be **divided into deliveries before and after on a percentage basis**.

## Packing units and evaluations

All articles can be delivered in **different packing units**. Articles can be evaluated by piece, kilogram, and turnover. The consumption figures can be determined optionally per bed, per patient care day, per billing day, or per case (for operating room wards). Likewise, by comparing ordered and delivered quantities, you can determine whether your laundry stock needs to be increased in the future. Various proforma invoices are available for budget customers.

## Advantages

- Optimum consumption control
- Reserve and special quantities
- Holiday planning, event management, express surcharges, etc.
- Various proforma invoices
- Various consumption statistics
