

TIKOS wipers

The module for a simplified recording

Our wipers module was developed to optimally organise the complete cleaning process of cleaning cloths. From the **separate delivery** of the soiled cloths to the **separate billing**, our module helps you keep track of everything.

Continuous separate processing

Completely separate order entry and billing is possible. Depending on the customer, only the cleaning can be billed or the rental can also be included. The soiled items are delivered loose in containers. The weight of the soiled laundry is recorded and an accompanying document is automatically created in TIKOS, which runs through the entire cleaning process together with the soiled laundry and serves to **record all relevant information** for the billing as well as for the calculation of internal operating costs. In connection with the route management module, individual routes can be stored to enable separate collection and delivery of the wipers.

Simple billing by weight

The machine wipers can also be billed by weight. After each washing cycle, the "clean weight" is recorded and compared with the dirt weight. With the help of an already stored average weight, the **program automatically calculates** the return quantity. Based on your experience, a certain percentage for a replacement quantity can be stored in TIKOS for automatic determination and allocation to the customer order in the event of a weight deviation. In this way, even the inevitable shrinkage of wipers is taken into account to the satisfaction of your customer.

Data conveniently available for internal and external calculation

In the end, the data from the accompanying document is simply and conveniently transferred to the program when the delivery note is created - **without any additional work step**. Based on the entry of the actual washing program, the post-wash and post-drying processes as well as the batch number of the individual washing processes, the average operating costs can thus be calculated and analysed. All relevant data is made available clearly and completely in TIKOS. All information can be easily retrieved and used for recalculations.

Advantages

- Can be organised as a completely separate service
- Separate washing process is possible
- Separate delivery note and separate delivery possible
- Delivery loose or in bundles possible
- Calculation according to individually defined price units
- Calculation for rental or processing
- Simple inventory management and determination of internal operating costs
